

“A Barangay Online Request Form and Email Notification”

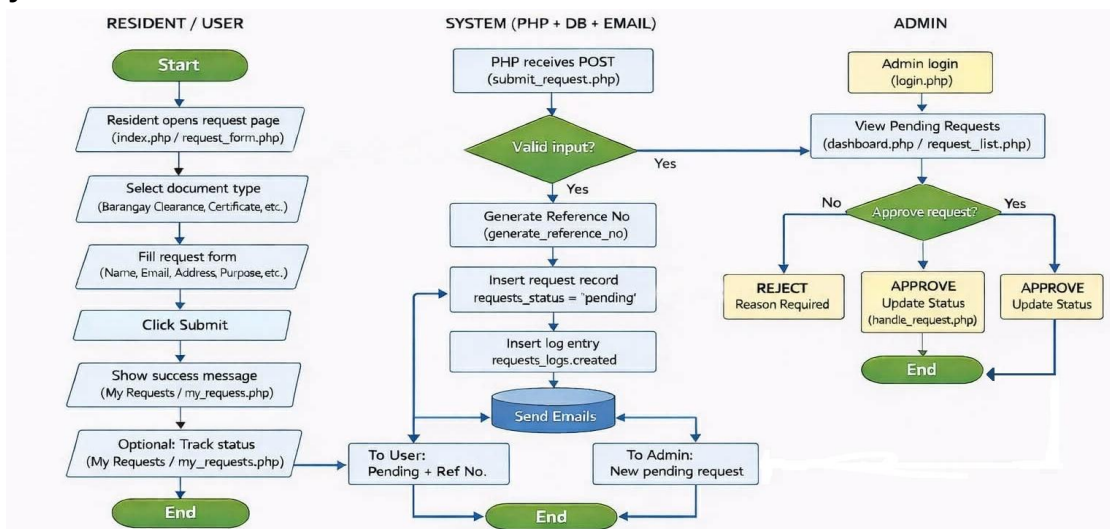

1. Project Idea & Requirements

Project Description - Residents in the barangay can request what they need, just submit the documents and they will be emailed confirmation and updates. Staff will review, update and track for a fast process.

Smart Requirements

- The system should provide an online request form where the resident's data should be saved in the database within 3 seconds.
- The system should be able to email the resident within 1 minute after their request is approved or rejected.
- The admin module should allow staff to view, approve or reject requests with complete date and time.

2. System Architecture

3. Core Tools

- **Front End - HTML, CSS, Bootstrap, JavaScript** - We will use this for creating the system interface.
- **Back End - PHP, XAMPP (Apache/PHP)** - It is responsible for processing requests and validation.
- **Database – My SQL** - We will use this for storing data in the system.
- **Email Notification - PHPMailer + SMTP** – For the email notification.

4. Life Cycle (4 weeks)

Week 1: Planning/Analysis (Gather and finalize system requirements) + Design (Create the system architecture and flowchart)

Week 2: Development (Dashboard, request form)

Week 3: Development (admin/status) + Testing (email/UI)

Week 4: Testing (system testing) + Maintenance (minor fixes)

5. Groupings Process

- Looking for groupmates in the same section/class.
- Asked about skills (UI, Backend, Testing).
- Assign their roles based on skills.
- Set a communication channels and meeting schedule.
